INSTRUCTIONS FOR USE

Step 1

Open the flight case station by snipping the cable ties either side or remove carefully if reusable ties have been used. Dispose of ties responsibly.

Step 2

Inside the station there are 3 carrying trays with cup holder inserts, 2 lids, a sealed pack containing hose with water gun, ready fitted ½ inch male to ¾ inch female adaptor, ¾ inch rubber sealing washers and two cable ties for closing flight case on return.

Step 3

Attach the hose to the threaded tap on the Event water supply standpipe (PTFE tape and additional 3/4 washers may be required depending on quality and number of threads on the tap) or to a MDPE Male adapter (20mm x ¾ inch depending on mains pipe diameter).

Check for water tightness and adjust accordingly.

Step 4

Test thumb lever on water gun. The pressure can also be adjusted when filling by varying the pressure on the gun lever or turning the tap clockwise.

Step 5

Position the 3 trays on top of the flight case as illustrated – 2 stacked and one in front. This gives a good ergonomic height to fill and refill the trays.

Step 6

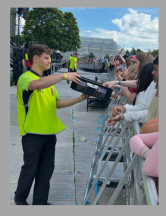

Load the trays with the event cups (usually 7 or 8oz paper cups). Fill the cups with water using the gun.

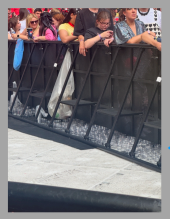

Step 7

Lift the tray using the handles either side and present the tray to the audience at the front of stage barrier so they can lift them out themselves.To deploy filled cups to those further back from the barrier you should lift the cups at the side of the cup so fingers do not enter the cup itself.

Step 8

Once tray is empty return to the filling station and lift another filled tray for use. There is no need to pre-fill cups and then store them on or below the barrier where they are exposed to contamination.

Step 9

Pre-filling of the 3 trays can take place in readiness and the supplied lids can be placed on top of the trays to prevent contamination.The lids are also useful during confetti shots to prevent confetti getting into the cups!

INSTRUCTIONS FOR USE

- **Once the event has finished each day, dispose of any cups in the trays and place the trays and lids inside the flight case and close the lid.**
- **Set up next day as described if multi day event**
- **On completion of the event, remove any water that may have gathered inside the flight case, place the 3 trays, 2 lids, hose and gun, washers inside the flight case.**
- **Secure the lids with the cable ties provided.**
- **Place the flight cases in a safe place to prevent any damage during the barrier load out overnight.**
- **Stack stations back on the delivery pallets, pallet wrap to secure the load and refer to uplift information.**
